

The Award Winning

Here is why thousands of body shops around the globe are switching to this advanced system:

WE'RE NO. 1

- It is simple to use ● It saves time...up to 85% time savings on metal work and metal finishing ● It saves on material costs... virtually no studs and less filler ● Better quality work ●
- PLUS - EAGLE II**
- Gives you top quality made in the U.S.A. construction ●
 - Super pricing (little more than a nail gun) ●

Remove paint to allow the magnetic ground and the electrode to adhere to the applicable area.

Manually, or with use of the low pressure pry-bar, pull the metal to the required position. Repeat the process until satisfied.

If the metal is pulled too far or stretched, shrink it back to a more manageable size. To shrink, simply increase the timer setting and apply pressure with the shrink on the end of the weld handle. This process may be repeated many times without weakening the metallic structure.

Repeat the process until damage is restored then file-finish or fill and sand and prepare for painting

The quality built American made Eagle II is a real time saver for body shops--or for anyone who works with metal body panels. Unit is sturdy enough to sit on while you work.
